

Defining the Cutting Edge

Onboard Weight Management Technology

Loadman® Fleet Management GPS Software provides management with the specific control to:

- ➔ Collect load data directly from our in-cab meter into the Fleet Management Software in real time using available data collection options.
- ➔ Identify and zoom in on actual vehicles and customer coordinates within seconds using the GPS Mapping option.
- ➔ Make informative, cost-effective decisions based on 'in-field' information that can be accessed with the push of a button.

FEATURES

Fleet Management Software: Loadman provides a Windows based Fleet Management Software program with GPS Mapping capability that is designed to retrieve load data by date, time, customer account and product. The GPS addition allows the added feature of automatically identifying the customer account by its GPS coordinate without human intervention. With the addition of the wireless data collection option, data can be collected when the vehicle is within approximately 1000 ft. of the base station or alternatively in real time using the cell phone option that is limited only by the availability of the cell phone service.

GPS Mapping Option: The GPS Mapping option has the added benefit of allowing you to track the individual trucks in your fleet. By setting up the data collection to include real time GPS position of each truck you can play back position data at a programmable speed so you can actually see where each truck has been while on route.
